

CS-AML FRAMEWORK

Civil Society Anti-Money Laundering & Financial Intelligence Framework

Version 0.1 | Normative Draft | October 2026

Purpose

A structured, evidence-based framework for civil society organisations, investigative journalists, public-interest researchers, and accountability actors to develop lawful, reproducible, and responsible financial intelligence without assuming the powers or access rights of regulated financial institutions, FIUs, or law-enforcement agencies.

This document defines the minimum analytical, evidentiary, governance, and technology-neutral requirements for CS-AML v0.1. It is designed as an internal standard and reference model. It does not create legal powers, does not authorise access to non-public financial records, and is not a substitute for legal advice, statutory AML obligations, FIU analysis, or criminal investigation.

Document Control

Field	Value
Document	CS-AML Framework v0.1
Status	Normative Draft
Version	0.1
Date	October 2026
Primary audience	Civil society organisations, investigative journalists, public-interest researchers, accountability and anti-corruption actors
Primary function	Open-source and lawfully sourced financial intelligence and AML-oriented investigation
Not intended as	Bank transaction-monitoring standard, STR/SAR filing standard, law-enforcement procedure, or legal opinion

Normative Language

The key words MUST, MUST NOT, SHALL, SHALL NOT, SHOULD, SHOULD NOT, MAY, and OPTIONAL are used to distinguish mandatory controls from recommended and discretionary practices.

Term	Meaning
MUST / SHALL	Mandatory for conformance with CS-AML v0.1.
MUST NOT / SHALL NOT	Prohibited within a conformant implementation.
SHOULD	Strongly recommended; deviation requires documented rationale.
SHOULD NOT	Normally avoided; use requires documented rationale.
MAY	Permitted but optional.

Conformance Levels

Level	Minimum expectation
-------	---------------------

Foundational	Case, source, evidence, entity, relationship, hypothesis, assessment, audit trail, and guardrails are implemented.
Operational	Adds asset mapping, event/timeline analysis, value-flow analysis, typology mapping, peer review, and intelligence products.
Advanced	Adds entity resolution automation, graph analytics, structured confidence scoring, cross-case correlation, quality assurance, and controlled data integrations.

1. Purpose, Scope, and Positioning

1.1 Purpose

CS-AML is a civil-society financial-intelligence framework for transforming lawful information into structured, reviewable, and decision-useful financial intelligence. Its primary objective is to support public-interest investigation while preserving analytical discipline, source protection, privacy, provenance, and procedural fairness.

- Identify relationships among persons, organisations, companies, assets, contracts, events, and economic value.
- Reconstruct value flows where direct banking data is unavailable.
- Compare observed patterns with known money-laundering and financial-crime typologies.
- Test competing hypotheses rather than confirming a predetermined allegation.
- Produce intelligence products suitable for internal decision-making, further investigation, lawful referral, or responsible publication.

1.2 Scope

CS-AML v0.1 applies to investigations based on public information, lawfully obtained records, voluntary disclosures, whistleblower material received through lawful channels, and other sources that the organisation is authorised to process. It is technology-neutral and can be implemented using paper procedures, spreadsheets, case-management systems, graph databases, or integrated investigative platforms.

1.3 Position in the AML Ecosystem

Regulated institution	Civil society	State authority
KYC / transaction monitoring	-> research / investigation	-> FIU / regulator / law enforcement
STR / SAR obligations	public-interest intelligence	statutory analysis / coercive powers

Civil society does not become a regulated AML reporting entity merely by using this framework. CS-AML operates as an independent investigative and intelligence discipline. In Indonesia, PPATK has explicitly recognised that initial information from NGO/CSO and the public can contribute to early detection of suspected money laundering. This framework therefore focuses on improving the quality, structure, reproducibility, and responsible handling of such information.

2. Foundational Principles

P1. Evidence before allegation

Investigation SHALL begin with an issue, question, anomaly, or relationship to be tested—not with a presumption of guilt.

P2. Follow the value

Investigators SHALL follow economic value through money, assets, ownership, control, contracts, debt, benefits, and other forms of economic transfer. Direct bank records are not required to reconstruct every relevant value relationship.

P3. Lawful and proportionate collection

Information MUST be collected and processed lawfully, for a defined purpose, and in a manner proportionate to investigative need.

P4. Fact ≠ inference ≠ hypothesis ≠ allegation

Every analytical statement MUST be classified so readers can distinguish what is directly evidenced from what is inferred or alleged.

P5. Competing hypotheses

Investigators MUST identify reasonable alternative explanations and actively search for contradicting evidence.

P6. Data minimisation

The organisation MUST NOT collect personal or sensitive data merely because it is technically obtainable.

P7. Provenance and reproducibility

Material findings MUST be traceable to sources, evidence, analytical steps, dates, and responsible analysts.

P8. Source and subject protection

The safety of sources, whistleblowers, staff, subjects, and affected communities MUST be incorporated into collection, storage, review, and dissemination decisions.

P9. Human judgement

Automated tools MAY support analysis but MUST NOT independently convert a pattern match into an allegation or adverse determination.

P10. Right-sized risk

Controls SHOULD be proportionate to risk; low-risk inquiries should not be burdened with unnecessary intrusive measures, while high-risk matters require stronger review and protection.

Analytical Chain

SOURCE → EVIDENCE → FACT → INDICATOR → HYPOTHESIS → ASSESSMENT → INTELLIGENCE PRODUCT. A conformant implementation SHALL preserve this distinction throughout the lifecycle.

3. Investigation Lifecycle

Stage	Name	Required outcome
1	Case initiation	Capture the trigger, public-interest purpose, intake source, and initial risk.
2	Scoping	Define investigation question, subjects, time period, jurisdiction, exclusions, and expected outputs.
3	Collection planning	Identify lawful sources, collection methods, data minimisation constraints, and source risks.
4	Collection and preservation	Acquire, archive, hash where appropriate, and document provenance.
5	Entity resolution	Determine whether records refer to the same person, organisation, asset, or other entity.
6	Relationship mapping	Create explicit, sourced relationships among entities.
7	Asset and event mapping	Identify ownership/control/use of assets and build a dated event timeline.

8	Value-flow reconstruction	Map transfers or transformations of economic value, with uncertainty explicitly recorded.
9	Typology and indicator analysis	Compare facts and patterns with recognised typologies without treating similarity as proof.
10	Hypothesis testing	Evaluate supporting, contradicting, missing, and alternative explanations.
11	Assessment	Produce analytic judgements with confidence statements and intelligence gaps.
12	Review and dissemination	Peer review, legal/editorial review as appropriate, then close, continue, refer, or publish.

3.1 Lifecycle Gate Requirements

The following gates SHALL prevent weak or unsafe cases from automatically progressing:

- Gate A – Authority and purpose: lawful purpose and access basis are documented before intrusive collection.
- Gate B – Evidence sufficiency: material facts have source provenance before typology mapping.
- Gate C – Analytical integrity: competing hypotheses and intelligence gaps are recorded before final assessment.
- Gate D – Dissemination review: sensitive external reporting receives peer review and appropriate legal/editorial review.

4. Core Domain Model

CASE

└─ SOURCE

└─ EVIDENCE

└─ ENTITY

└─ RELATIONSHIP

└─ ASSET

└─ EVENT

└─ VALUE FLOW

└─ INDICATOR

└─ TYPOLOGY

└─ HYPOTHESIS

The domain model defines semantic separation between records. Implementations MAY use different database schemas, but they SHALL preserve equivalent distinctions.

4.1 Case

A Case is the investigative context, not the primary container of truth. A person, company, asset, source, or evidence item MAY be relevant to multiple cases. Systems SHOULD support controlled cross-case linking without duplicating or silently mutating source records.

Required field	Description
Case ID	Unique persistent identifier.
Title	Neutral, descriptive title; SHOULD NOT assert guilt.
Investigation question	The principal question the case seeks to answer.
Purpose/public interest	Why the investigation is legitimate and necessary.
Scope	Subjects, period, jurisdictions, included and excluded issues.
Predicate issue	Known or alleged underlying conduct, if relevant.
Status	Intake, scoped, collecting, analysing, review, disseminated, closed.
Risk classification	Operational, source, legal, privacy, and safety risks.
Owner/reviewer	Responsible analyst and reviewer.
Retention class	Required retention and disposal handling.

4.2 Source

A Source describes where information originates. It SHALL be distinct from the evidence extracted from it.

Attribute	Requirement
Source ID	Persistent unique identifier.

Source type	Registry, court record, procurement record, media, website, social media, interview, whistleblower, dataset, document, other.
Publisher/custodian	Who published or supplied it.
Location	URL, archive URI, repository path, or physical reference.
Access date	When the organisation accessed it.
Publication date	Where known.
Access status	Public, permissioned, confidential, restricted, unknown.
Reliability	Source reliability rating plus rationale.
Preservation	Archived copy or reason not retained.
Sensitivity	Public, internal, confidential, highly restricted.

4.3 Evidence

Evidence is a preserved item or extract that supports or contradicts an analytical proposition. Evidence SHALL retain a link to its Source and MUST NOT be rewritten in a manner that obscures the original context.

- Digital evidence SHOULD be preserved in original form when lawful and feasible.
- Material files SHOULD have a cryptographic hash recorded, preferably SHA-256.
- Screenshots SHOULD include enough context to identify the page, date, and relevant content; a screenshot alone SHOULD NOT replace preserved source content where an archive is available.
- Translations and analyst extracts MUST identify the original material and translator/analyst where relevant.

4.4 Entity

An Entity is a uniquely tracked object about which facts and relationships are recorded. Entities SHOULD use stable internal identifiers independent of names.

Entity class	Examples
Person	Natural person, aliases, public official, professional intermediary.

Organisation	Company, NGO, foundation, agency, trust or other legal arrangement.
Financial identifier	Account reference, wallet, payment handle—only where lawfully obtained.
Asset	Property, vehicle, vessel, aircraft, securities, digital asset.
Contact/technical	Phone, email, domain, address, device identifier where lawful and relevant.
Commercial/public	Contract, procurement project, grant, licence, concession.
Document/case	Court case, corporate filing, licence, report, invoice, deed.

4.5 Entity Resolution

Entity resolution is the process of deciding whether multiple records refer to the same real-world entity. A conformant implementation SHALL support uncertainty and SHALL NOT force uncertain matches into a single entity.

Evidence class	Examples	Typical weight
Strong identifiers	Registration number, verified date of birth plus another identifier, official unique ID where lawful.	High
Strong relational	Same confirmed beneficial owner, same verified legal address plus matching officers.	Medium–High
Weak identifiers	Name similarity, shared surname, common address, visual resemblance.	Low
Contextual	Same business domain, same event, same social network.	Low–Medium

Every merge SHOULD record match reason, supporting evidence, confidence, analyst, and date. Every split or reversal SHOULD preserve the audit history.

4.6 Relationship

A Relationship is an explicit, directional or non-directional link between two entities. The relationship SHALL carry its own evidence and confidence; it MUST NOT inherit confidence simply because both entities are verified.

Relationship family	Examples
Ownership/control	OWNS, BENEFICIAL_OWNER_OF, CONTROLS, NOMINEE_FOR.
Governance/employment	DIRECTOR_OF, COMMISSIONER_OF, EMPLOYED_BY, REPRESENTS.
Personal/association	RELATIVE_OF, ASSOCIATE_OF, BUSINESS_PARTNER_OF.
Shared attributes	SHARES_ADDRESS_WITH, SHARES_PHONE_WITH, SHARES_DEVICE_WITH.
Commercial	SUPPLIER_TO, CONTRACTED_BY, SUBCONTRACTED_TO, INVESTED_IN.
Financial/value	PAID_BY, TRANSFERRED_TO, LOANED_TO, DONATED_TO.
Asset	OWNS_ASSET, CONTROLS_ASSET, USES_ASSET, SOLD_TO, LEASED_TO.

4.7 Asset

Asset records SHALL distinguish legal ownership, beneficial ownership, control, possession/use, and economic benefit. These concepts MUST NOT be collapsed into a single “owner” field.

Field	Examples
Asset type	Land/building, vehicle, vessel, aircraft, shareholding, security, crypto asset, IP right.
Legal owner	Person/entity appearing in authoritative ownership record.
Possible beneficial owner	Analytical proposition, with evidence and confidence.
Controller/user	Who appears to control or use the asset.

Value	Known price, declared value, estimate, range, or unknown.
Acquisition/disposal	Date, mechanism, counterparty, consideration where known.
Source/evidence	Registry, filing, court record, contract, publication, other.

4.8 Event and Timeline

Events anchor entities and relationships in time. Timeline analysis SHALL distinguish date-known, date-estimated, and date-unknown events. Correlation in time MUST NOT be described as causation without additional evidence.

- Examples: company creation, officer change, contract award, asset acquisition, licence issuance, court filing, ownership transfer, resignation, dissolution, loan, donation, or public appointment.

4.9 Value Flow

Value Flow represents a transfer, allocation, conversion, or transformation of economic value. It is broader than bank transfer and is the core of the CS-AML “follow the value” method.

Value-flow type	Example
Payment	Buyer → supplier.
Contract allocation	Government/Donor → prime contractor.
Subcontract	Prime contractor → subcontractor.
Loan/debt	Lender → borrower; repayment in reverse direction.
Investment/equity	Investor → company / ownership interest.
Asset conversion	Cash/value → property, vehicle, shares, digital asset.
Donation/grant	Donor → recipient.
Sale/disposal	Asset → buyer, with consideration where known.
Non-cash benefit	Use, control, concession, preferential access, or other economic benefit.

Critical rule

Where value, origin, destination, or mechanism is unknown, the field SHALL remain unknown. Investigators MUST NOT infer an exact financial transfer merely because related events occur near each other in time.

4.10 Indicator

An Indicator is an observed fact or pattern relevant to a financial-crime hypothesis. An indicator is not a finding of money laundering. Indicators SHOULD be atomic, testable, and linked to evidence.

- Example: multiple related companies share one address.
- Example: corporate officers change rapidly shortly before or after a major contract.
- Example: an asset is acquired by a related entity soon after a large value event.
- Example: a company has significant contracts but little observable operating footprint.

4.11 Typology

A Typology is a recognised pattern of conduct that may be associated with money laundering or related financial crime. Typology mapping SHALL be used as an analytical aid, not as proof of criminal conduct.

Typology	Illustrative indicators
Nominee ownership	Formal owner differs from apparent controller; shared addresses, close associates, unusual control arrangements.
Shell-company layering	Multiple entities, thin operational footprint, repeated officer/address overlap, sequential transfers.
Asset conversion	Economic value appears converted into property, vehicles, shares, or digital assets.
Circular ownership/value	Ownership or value returns to an originating or related entity through a chain.
Professional intermediary	Lawyer, accountant, agent, nominee, company service provider, or other intermediary appears to structure control or transfer.
Trade-/contract-based laundering	Contracts, invoices, goods/services, procurement, pricing, or cross-border trade may be used to move or disguise value.

Mule/funnel pattern	Many sources converge to an intermediary entity then rapidly disperse or consolidate, where evidence exists.
---------------------	--

4.12 Hypothesis

A Hypothesis is a proposition that explains observed facts and is capable of being supported, weakened, rejected, or left inconclusive. Every significant case **SHOULD** maintain at least one legitimate alternative hypothesis.

Field	Requirement
Hypothesis ID	Unique identifier.
Statement	Specific, neutral, falsifiable proposition.
Supporting evidence	Evidence that increases plausibility.
Contradicting evidence	Evidence that decreases plausibility.
Alternative hypotheses	Reasonable competing explanations.
Unknowns	Facts needed to evaluate further.
Status	Open, supported, weakened, rejected, inconclusive.
Confidence	Analyst confidence with rationale.

4.13 Assessment

An Assessment is a reasoned analytical judgement derived from facts, indicators, tested hypotheses, and acknowledged gaps. It **SHALL** state confidence and **MUST NOT** overstate what the evidence establishes.

Example

“Available public-source information indicates that Company A and Company B are likely under common control. Confidence: moderate. This assessment is based on shared beneficial-ownership records, overlapping directors, and common addresses. Direct financial transactions and purchase consideration are not available and remain intelligence gaps.”

4.14 Intelligence Product

An Intelligence Product is the controlled output of the analytical process. Products MAY include Financial Intelligence Notes, Investigation Briefs, Entity Profiles, Asset Profiles, Network Analyses, Case Reports, and Referral Packages.

5. Analytical Standards

5.1 Fact, Inference, Hypothesis, Allegation

Class	Definition	Example
Fact	Directly supported by identified evidence.	Company X lists Person A as director in an official filing.
Inference	Reasoned conclusion drawn from one or more facts.	Person A likely has management influence over Company X.
Hypothesis	Testable explanatory proposition.	Company X may act as a nominee structure for Person B.
Allegation	Claim that misconduct occurred.	Company X was used to launder proceeds.

All analyst notes and products SHOULD use language that reflects the class of statement. Systems SHOULD provide visual labels or metadata to prevent accidental collapse of these categories.

5.2 Confidence Model

CS-AML v0.1 uses two separate axes: source reliability and information credibility. Organisations MAY map these to an existing intelligence rating scheme, provided both concepts remain distinct.

Source rating	Meaning
A	Highly reliable
B	Generally reliable
C	Mixed reliability
D	Generally unreliable
E	Unreliable
F	Unknown / insufficient history

Information rating	Meaning
1	Independently confirmed / directly corroborated
2	Probably true
3	Possibly true
4	Doubtful
5	Improbable
6	Cannot be judged

The combined code (for example A1, B2, F3) describes source and information separately. It SHALL NOT be used as a numeric probability unless the organisation has a documented calibration method.

5.3 Analytical Confidence Statements

Confidence	Use
High	Multiple independent high-quality sources or direct authoritative evidence support the judgement; material contradictions are absent or explained.
Moderate	The judgement is supported by credible evidence but meaningful gaps, assumptions, or unresolved contradictions remain.
Low	Limited, indirect, or weakly corroborated information supports the judgement; alternative explanations remain substantial.

5.4 Intelligence Gaps

Every material assessment SHALL identify the information that would most change the judgement. Typical gaps include direct transaction data, source of funds, beneficial ownership, asset purchase consideration, tax records, contractual performance, foreign corporate records, or identity confirmation.

5.5 Negative Evidence and Absence

Absence of public evidence SHALL NOT automatically be treated as evidence of absence. Statements such as “no operating activity” SHOULD be framed as “no operating activity was identified in the sources reviewed as of [date]” unless a stronger evidentiary basis exists.

6. Lawful Collection, Privacy, and Ethics

6.1 Collection Categories

Category	Examples	Default handling
Public authoritative	Corporate registries, procurement portals, court decisions, official disclosures.	Collect and preserve; verify scope and currentness.
Public non-authoritative	Company sites, media, open social media, public directories.	Collect cautiously; corroborate material claims.
Permissioned/confidential	Voluntary disclosures, internal records, whistleblower material.	Collect only under appropriate authority, security, and source-protection procedures.
Restricted/sensitive	Personal financial data, criminal records, private communications.	Process only where lawful, necessary, and proportionate; apply enhanced access controls.
Unlawfully obtained/accessed	Hacked systems, stolen credentials, unauthorised interception.	MUST NOT be solicited or accessed through unlawful means; obtain legal advice for unsolicited material.

6.2 Indonesian Personal Data Context

Under Indonesia’s Law No. 27 of 2022 on Personal Data Protection, personal financial data and criminal records are classified as specific personal data. A CS-AML implementation operating in Indonesia SHOULD therefore treat these classes as high-sensitivity by default and establish documented purpose, access, security, retention, and dissemination controls before processing them.

6.3 Collection Decision Test

1. Is the investigative purpose legitimate and documented?
2. Is the source access lawful or authorised?
3. Is the information relevant to the investigation question?
4. Is collection necessary and proportionate?

5. Is a less intrusive source sufficient?
6. Can the information be stored securely?
7. Is retention necessary?
8. Can it be disseminated, and to whom?

6.4 Prohibited Practices

- Unauthorised access to accounts or systems.
- Credential theft, password reuse, or use of stolen credentials.
- Impersonation or pretexting designed to obtain protected financial data without lawful authority.
- Illegal interception of communications.
- Purchase or solicitation of stolen credentials or clearly illicitly acquired personal datasets.
- Doxxing, harassment, intimidation, or unnecessary publication of private data.
- Automated accusations, blacklists, or adverse labels based solely on algorithmic scoring.

7. Follow-the-Value Method

7.1 Concept

Civil society commonly lacks lawful access to bank transaction records. CS-AML therefore broadens traditional “follow the money” into “follow the value”: trace how economic value is created, allocated, controlled, transferred, transformed, or enjoyed using open and lawfully obtained information.

7.2 Direct vs Reconstructed Trails

Trail	Definition	Typical civil-society use
Direct financial trail	Evidence of an actual transfer between financial accounts or wallets.	Use only where records are lawfully available.
Reconstructed value trail	Inference from contracts, corporate relations, asset transfers, invoices, ownership changes, disclosures, court records, and chronology.	Primary method where direct transactions are unavailable.

7.3 Reconstruction Rules

- Every edge in a value-flow map MUST identify whether it is observed, reported, inferred, or hypothetical.
- Contract value MUST NOT be assumed to equal profit, personal benefit, or money transferred to a related party.

- Asset acquisition near a contract award MAY be an indicator, but temporal proximity alone does not establish funding source.
- Ownership SHOULD be separated from control and use.
- Where value is estimated, the basis and range SHOULD be recorded.

7.4 Value-Flow Example

The example supports a sequence of economic relationships. It does not, by itself, establish that contract proceeds funded Property P or that Person C laundered money. The funding-source link remains a hypothesis unless evidence establishes it.

8. Graph and Network Analysis

8.1 Purpose

Graph analysis is used to reveal relationships that are difficult to identify in tabular records. It SHOULD enhance, not replace, evidence review.

8.2 Node and Edge Semantics

Graph component	Rule
Node	Represents an entity, asset, event, contract, document, or other defined object.
Edge	Represents an explicit relationship or value flow; SHALL have provenance and confidence.
Derived edge	Computed by rule or algorithm; MUST be labelled as derived.

Hypothetical edge	Analytical proposition; MUST NOT visually appear equivalent to verified relationship.
Cross-case edge	SHOULD respect access restrictions and purpose limitations of each case.

8.3 Permitted Analytical Techniques

- Shared-attribute analysis: address, officer, phone, domain, service provider, or other identifiers.
- Path analysis: identify how a subject connects to an asset, company, contract, or intermediary.
- Centrality and hub identification: prioritise structurally significant nodes for review.
- Community/cluster detection: identify dense groups for analyst inspection.
- Cycle detection: identify circular ownership or value relationships.
- Temporal graph analysis: identify changes in relationships over time.

Automated graph findings SHALL be treated as leads until supported by evidence and analyst review.

9. Typology Analysis

9.1 Typology Matching Model

9.2 Typology Object Requirements

A configurable typology definition SHOULD contain: typology ID, name, description, relevant predicate context, expected indicators, disconfirming indicators, required evidence strength, jurisdiction notes, references, version, and review date.

9.3 Avoiding Typology Overreach

- A typology match SHALL NOT automatically raise an allegation.
- Common business practices that resemble indicators MUST be assessed in context.
- Analysts SHOULD document benign explanations for each material typology match.
- Typology libraries SHOULD be periodically reviewed against authoritative sources such as FATF, FIU publications, court decisions, and reputable research.

10. Review, Escalation, and Dissemination

10.1 Escalation States

State	Meaning	Default action
Information only	Insufficient analytical significance.	Archive or monitor.
Analytical lead	Potentially relevant pattern requiring more collection.	Continue targeted research.
Active investigation	Defined hypothesis and evidence plan.	Collect, test, review.
Reasonable indicators	Multiple supported indicators warrant independent review.	Peer review and risk/legal assessment.
Actionable intelligence	Structured package can support a legitimate external decision or further investigation.	Refer, brief, or publish under controlled process.

10.2 Dissemination Paths

- Internal: programme leadership, legal, security, or governance review.
- Regulatory/FIU referral: structured factual package, where lawful and appropriate.
- Law enforcement or anti-corruption body: where the matter falls within jurisdiction and safety risks are managed.
- Investigative publication: fact-checked, legally reviewed where appropriate, and privacy-minimised.
- Partner CSO/journalist: only under clear handling and source-protection terms.

10.3 Minimum Referral Package

Section	Minimum content
Executive assessment	What the available evidence indicates, confidence, and key caveats.

Investigation question	What was examined and why.
Subjects/entities	Stable IDs, names/aliases, roles, identifiers.
Chronology	Material events and dates.
Relationship/asset graph	Sourced relationships only; inferred links clearly marked.
Value-flow analysis	Observed and reconstructed value relationships.
Typology indicators	Relevant indicators and benign alternatives.
Evidence index	Source, archive/reference, date, hash where applicable.
Intelligence gaps	What remains unknown.
Handling notes	Sensitivity, source protection, dissemination restrictions.

11. Governance and Roles

11.1 Minimum Roles

Role	Responsibilities
Case owner / analyst	Scoping, collection, analysis, documentation.
Peer reviewer	Challenge hypotheses, evidence quality, confidence, and wording.
Information-security custodian	Access control, secure storage, incident response, backups.
Legal/privacy reviewer	Required for high-risk collection, restricted data, or sensitive publication where available.
Editorial/management approver	Approves external dissemination under organisational policy.

11.2 Separation of Duties

High-impact external products **SHOULD NOT** be approved solely by the analyst who produced them. Sensitive referrals or publications **SHOULD** receive at least one independent analytical review and, where appropriate, legal/privacy review.

11.3 Case Risk Assessment

Each case **SHOULD** assess at least: source risk, subject risk, legal risk, privacy risk, physical safety risk, digital-security risk, retaliation risk, reputational risk, and harm-to-bystanders risk. Controls **SHALL** be proportionate to these risks.

12. Security, Auditability, and Data Governance

12.1 Access Control

- Least-privilege access **SHALL** apply to case data.
- Highly sensitive source identities **SHOULD** be compartmentalised from general case material.
- Administrative access **SHOULD** be logged and reviewed.
- Export and bulk-download capability **SHOULD** be restricted for sensitive datasets.

12.2 Audit Trail

A conformant digital implementation **SHALL** log material changes to evidence metadata, entity merges/splits, relationship assertions, hypothesis status, assessments, exports, and external dissemination decisions.

12.3 Integrity and Preservation

- Original evidence **SHOULD** be immutable or write-protected after preservation where feasible.
- Hashes **SHOULD** be used for material digital files.
- Analyst annotations **SHOULD** be stored separately from original files.
- Deletion and correction **SHOULD** preserve sufficient audit metadata to explain what changed and why, subject to lawful privacy/retention obligations.

12.4 Retention

Organisations **SHALL** establish retention schedules based on purpose, legal requirements, sensitivity, source agreements, and risk. “Keep everything forever” is not conformant with the data-minimisation principle.

13. Technology Capability Model

CS-AML v0.1 is technology-neutral, but the following capability model supports a scalable implementation.

Capability	Purpose
------------	---------

Investigation management	Case intake, scope, status, assignments, risks, tasks.
Source management	Source registry, reliability, access status, archiving.
Evidence management	Preservation, hashes, excerpts, verification, chain of provenance.
Entity resolution	Record linkage, aliases, merge/split review, match confidence.
Knowledge graph	Entity and relationship storage with provenance.
Asset tracing	Legal/beneficial ownership, control, use, valuation, transfers.
Timeline analysis	Events, date uncertainty, temporal comparison.
Value-flow analysis	Observed/inferred value relationships and transformations.
Typology engine	Configurable indicators and typology comparisons.
Hypothesis management	Supporting/contradicting evidence, alternatives, status.
Assessment workspace	Judgements, confidence, intelligence gaps.
Intelligence reporting	Reusable structured products and referral packages.
Audit/security	Access control, logs, sensitivity, retention, export controls.
Cross-case correlation	Controlled discovery of recurring entities/relationships across cases.

13.1 Conceptual Architecture

CASE / WORKSPACE

|

|— SOURCE REGISTRY — ARCHIVE

|— EVIDENCE STORE — HASH / PROVENANCE

|

ENTITY RESOLUTION

|

13.2 Critical Architectural Rules

- Entity and Evidence SHOULD be reusable truth objects; Case is contextual access and analytical workspace.
- Evidence MUST NOT be silently overwritten by analyst interpretation.
- Derived and hypothetical relationships MUST be visually and semantically distinct from verified relationships.
- Every analytical object SHOULD expose source provenance to the analyst.
- Automation SHOULD be explainable enough for analysts to understand why a match, score, or relationship was proposed.

14. Quality Assurance and Metrics

14.1 QA Checklist

- Investigation question remains neutral and answerable.
- All material facts link to evidence.
- Entity merges have documented match rationale.
- Relationship edges have provenance and confidence.
- Value-flow links distinguish observed from inferred.
- Alternative hypotheses are documented.

- Contradicting evidence is not omitted.
- Confidence is consistent with evidence quality and gaps.
- Sensitive personal data is necessary and access-controlled.
- External products received required review.

14.2 Suggested Metrics

Metric	Purpose
Evidence provenance completeness	Percentage of material assertions with source/evidence links.
Entity-resolution reversal rate	Quality signal for over-merging or weak matching.
Hypothesis challenge rate	Whether analysts record contradicting evidence and alternatives.
Referral usefulness	Qualitative feedback from recipients where available.
Correction rate	Number/severity of post-publication or post-referral corrections.
Sensitive-data exposure incidents	Security/privacy effectiveness.
Time to analytical decision	Operational efficiency, not a quality substitute.
Cross-case discovery yield	Value of controlled correlation capability.

Alert volume, graph size, number of entities, and number of allegations are NOT quality metrics and SHOULD NOT be used as performance targets.

15. Intelligence Product Standard

15.1 Required Structure

1. Executive Assessment
2. Investigation Question
3. Purpose and Scope
4. Method and Source Limitations
5. Key Entities
6. Key Findings
7. Relationship Analysis
8. Asset Analysis
9. Timeline
10. Value-Flow Analysis

11. Relevant Indicators and Typologies
12. Hypothesis Evaluation
13. Alternative Explanations
14. Intelligence Gaps
15. Confidence Assessment
16. Evidence Index
17. Recommended Next Steps
18. Handling / Dissemination Restrictions

15.2 Writing Standard

- Use neutral language and attribution.
- Prefer “records indicate”, “available information suggests”, or “we assess with moderate confidence” over categorical claims where evidence is incomplete.
- Avoid labels such as “money launderer”, “criminal”, or “shell company” as definitive descriptions unless supported by authoritative adjudication or clearly attributed allegation.
- State limitations close to the judgement they qualify, not only in a disclaimer at the end.

16. Implementation Roadmap for v0.1

16.1 Phase A – Method First

- Adopt case, source, evidence, entity, relationship, hypothesis, and assessment templates.
- Train analysts on fact/inference distinction, source reliability, hypothesis testing, and privacy.
- Establish peer-review and escalation procedure.

16.2 Phase B – Structured Data

- Move entity, relationship, asset, event, and value-flow records into structured storage.
- Introduce stable IDs, controlled vocabularies, confidence, and provenance.
- Implement cross-case duplicate detection under access controls.

16.3 Phase C – Graph and Automation

- Add graph visualisation and path/cluster/cycle analysis.
- Add assisted entity resolution with human approval.
- Add configurable typology rules and structured analyst feedback.
- Maintain explainability and never convert automation into automatic allegation.

17. Explicit Non-Goals of v0.1

- Replacing bank AML transaction-monitoring systems.
- Submitting statutory STR/SAR reports on behalf of regulated entities unless separately authorised by law.
- Performing covert surveillance or unauthorised account access.
- Creating public “risk scores” or guilt rankings of individuals.

- Automating criminal accusations.
- Building a general-purpose personal-data warehouse.
- Replacing FIU, regulator, prosecutor, police, court, or judicial functions.

18. Reference Alignment

CS-AML v0.1 is an independent civil-society framework. It is informed by, but does not claim formal compliance certification against, the following sources:

Reference	Relevance	URL
FATF Recommendations	Risk-based approach, beneficial ownership, financial intelligence, NPO safeguards.	https://www.fatf-gafi.org/en/publications/Fatfrecommendations/Fatfrecommendations.html
FATF NPO guidance / Recommendation 8	Focused, proportionate, risk-based measures and protection of legitimate NPO activity.	https://www.fatf-gafi.org/en/topics/non-profit-organisations.html

Annex A – Minimum Case Record

Case ID:

Title:

Investigation question:

Public-interest purpose:

Predicate issue (if any):
Subjects:
Time period:
Jurisdiction(s):
Scope exclusions:
Case risk:
Case owner:
Peer reviewer:
Status:
Retention class:
Dissemination restriction:

Annex B – Minimum Evidence Record

Evidence ID:
Source ID:
Title/description:
Original location:
Access date/time:
Publication date/time:
Archived copy:
SHA-256 (if file):
Extract / proposition supported:
Verification status:
Sensitivity:
Analyst:
Notes / limitations:

Annex C – Hypothesis Worksheet

Hypothesis ID:
Statement:
Why it matters:
Supporting evidence:
Contradicting evidence:
Alternative hypotheses:
Unknowns / intelligence gaps:
Next collection actions:
Status: OPEN / SUPPORTED / WEAKENED / REJECTED / INCONCLUSIVE

Confidence: LOW / MODERATE / HIGH

Analyst rationale:

Reviewer comments:

Annex D – Pre-Dissemination Review

- ☐ Every material factual claim is sourced.
- ☐ Inference and allegation are clearly distinguished.
- ☐ Contradicting evidence and alternatives are represented fairly.
- ☐ Sensitive personal data is necessary and minimised.
- ☐ Source identity and whistleblower risk are addressed.
- ☐ Graph visuals distinguish verified, derived, and hypothetical edges.
- ☐ Confidence and intelligence gaps are explicit.
- ☐ The intended recipient has a legitimate need for the information.
- ☐ Required peer, legal/privacy, editorial, and security reviews are complete.
- ☐ The dissemination decision and version are logged.

Annex E – v0.1 Design Axioms

#	Axiom
Axiom 1	Evidence is not an allegation.
Axiom 2	Case is context; Entity and Evidence are reusable truth objects.
Axiom 3	Every material relationship has provenance.
Axiom 4	Unknown is a valid value and is preferable to invented precision.
Axiom 5	Graph structure generates leads, not guilt.
Axiom 6	Typology similarity is an indicator, not proof.
Axiom 7	Analytical confidence must reflect both evidence quality and intelligence gaps.
Axiom 8	Civil society follows value lawfully; it does not imitate coercive state powers.
Axiom 9	Sensitive data requires proportional protection.
Axiom 10	A strong intelligence product makes uncertainty visible.
